```
cioure dentified by a combination of several methods: Gene prediction programs including Genscan and Genscan+ (Chris Burge, http://CCR-081.ntt.edu/GENSCAN.html), GeneMarkHWW (Mark Borodovsky, http://genemark.biology.gatech.edu/GeneMark/), FgeneBh (http://genemark.biology.gatech.edu/GeneMark/), FgeneBh (http://www.softberry.com/), and GeneSplicer (Wihaela Pertea and Steven Salzbergy, contact mperteadedigr.org), searches of the complete sequence against a peptide database and the plant EST database at TiGR (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as unknown proteins are named as prediction programs over most of their length are annotated as prediction programs over most of their length are annotated as hypotherical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.washington.edu/RW/Repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RW/Repeatmasker.html).

This is the pseudomolecule for rice chromosome 10, which was constructed by resolving discrepancies between overlapping BACs, trimming the overlap regions, and linking the unique sequences to form a contigous sequence. Genes in individual BAC clone were identified by a combination of several methods: Gene prediction programs, searches of the complete sequence against a peptide database and EST databases. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with BST similarity are named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their longth are annotated as hypothetical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Location/Qualifiers)

An Arabidopsis full-length cDNA library was constructed essentially as reported previously (Seki et al. (1998) Plant J. 15:707-720; Seki et al. (2002) Science 296:141-145).

This clone is in a modified pBluescript vector.

crouse were identified by a combination of several methods: Gene prediction programs including Genscan and Genscan+ (Chris Burge, http://CRc.081.mit.edu/GENSCAN.html), GeneMarkHWM (Mark Borodovsky, http://genemark.biology.gatech.edu/GeneMarkh), Fgenesh (http://www.softberry.com/), and GeneSplicer (Wihaela Pertea and Steven Salzberg, contact mperteaddig.corg), searches of the complete sequence against a peptide database and the plant EST database at TIGR (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as unknown proteins are named at proteins over named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction proteins over most of their length are annotated as hypothetical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE). Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RW/Repeatmasker.html).
                                                                          Oryza sativa (japonica cultivar-group)
Oryza sativa (japonica cultivar-group)
Oryza sativa (japonica cultivar-group)
Oryza sativa (japonica cultivar-group)
Sukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta;
Entartophyta; Magnoliophyta; Liliopsida; Poales; Poaceae;
Enthartoidaee; Oryzae; Oryza.

Genes in individual BAC clone were identified by a combination of several methods: Gene prediction programs, searches of the complete sequence against a peptide database and EST databases. Genes with similarity to other proteins are named after the database hits. Genes with similarity that are predicted by more than two gene prediction programs over most of their length are annotated as hypothetical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Invasiancy, Invasiancy, Interest Constitution (Interest Constitution) and the constitution (Interest Constitution) and Interest Constitution (Interest Constitution) and Interest Constitution (Int

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NOTE: This is a 'working draft' sequence. It currently consists of 31 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
